

4. Wireframe (Expanded)

What is a Wireframe?:

A **Wireframe** is a low-fidelity visual representation or blueprint of the layout of a dashboard or website. It serves as a prototype that defines the placement of various elements, such as charts, tables, and filters, within a dashboard.

Wireframes are crucial because they:

- Help in designing the layout and user interface of a dashboard.
- Provide a clear picture of how users will interact with the dashboard.
- Ensure that elements are logically organized to enhance user experience.

In this case, the wireframe for your Amazon Sales Data Dashboard would showcase how different KPIs, charts, and slicers are organized.

Add Screenshot and KPIs Explanation:

Now, let's take the wireframe design for your dashboard and break it down. You can include your screenshot of the dashboard here for reference. The layout typically includes the following sections:

- **Top Section (KPI Overview):**
 - Displaying major KPIs like **Monthly Revenue**, **Monthly Profit**, and **Monthly Cost**.
 - These KPIs are prominently placed at the top for quick, at-a-glance insights.
- **Middle Section (Visualizations):**
 - Visualizations such as **Bar Charts**, **Line Graphs**, and **Pie Charts** to represent revenue by item type, region, and order priority.
 - A **Time Series Line Chart** showing monthly revenue or profit over time.
- **Bottom Section (Tables and Detailed Insights):**
 - Tables displaying detailed revenue, profit, and cost data for each region, item type, and order priority.
 - Filters/Slicers allowing users to drill down on data by region, month, or year.
- **Sidebar (Slicers):**
 - Interactive **Slicers** for **Region**, **Month**, and **Year** to allow users to filter the data dynamically.
